

# Carbenes

- Stable Free Carbenes :

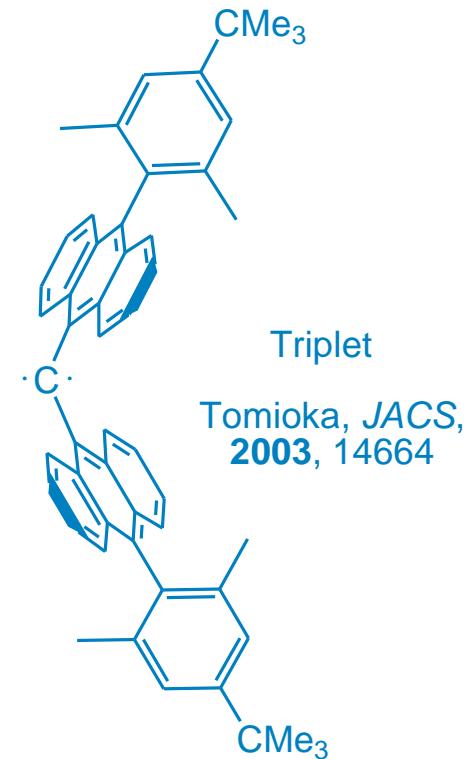

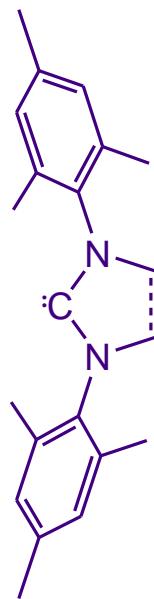

Science, 2000,  
288, 834

JACS, 2004, 8670

Guy Bertrand

Arduengo Carbene or  
NHC (N-Heterocyclic Carbene)

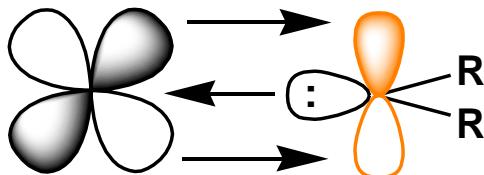

Triplet  
Tomioka, JACS,  
2003, 14664

# Transition Metal Carbene Complexes

## FISCHER

- Electrophilic Carbon

properties

neutral  $\text{CR}_2$  (L-type ligand)  
(similarities to  $\text{PR}_3$ )

strong  $\sigma$ -donor  
poor or OK  $\pi$ -acceptor

2-electron donor

$\text{R} = \pi\text{-donor}$   
( $\text{OR}$ ,  $\text{NR}_2$ ,  $\text{Ph}$ )

typical R groups in  $\text{CR}_2$

typical metals

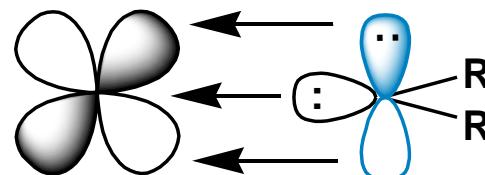

Late TMs, Low oxidation  
states ( $\text{Mo}^0$ ,  $\text{Fe}^0$  etc.)

typical co-ligands

$\pi$ -acceptors  
( $\text{CO}$ ,  $\text{CNR}$ ,  $\text{P}(\text{OR})_3$ )

## SCHROCK

- Nucleophilic Carbon

$\text{CR}_2^{2-}$  (X<sub>2</sub>-type ligand)  
(similarities to  $\text{M}=\text{O}$  or  $\text{M}=\text{NR}$ )

strong  $\sigma$ -donor  
strong  $\pi$ -donor

4-electron donor

$\text{R} = \text{H, Alkyl}$

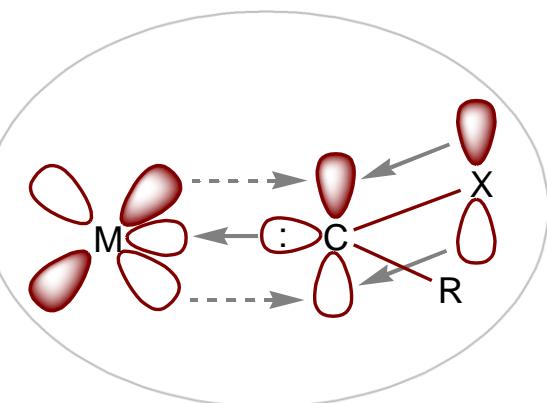

Early TMs (often  $d_0$ ), High  
oxidation states ( $\text{Ta}^{\text{V}}$ ,  $\text{W}^{\text{VI}}$ )

$\text{Cl}^-$ ,  $\text{Cp}^-$ , Alkyl,  
Imido, Amido

# Transition Metal Carbene Complexes

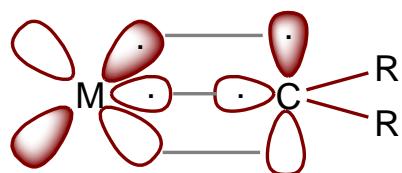

- **Carbenes ( $\text{CR}_2$ )** – these are not redox active ligands – i.e. Fischer or Schrock complexes have the same number of electrons. The difference is whether the carbene carbon is nucleophilic (Schrock) or electrophilic (Fischer).

Fischer Carbene

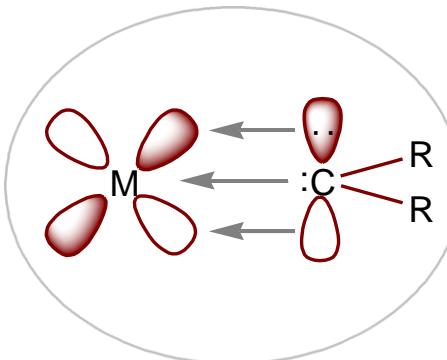

- only one way to look at a Fischer carbene
- neutral singlet carbene
- 1 donor covalent bond + weak  $\pi$ -backdonation
- 2 electron donor

Schrock Carbene

- neutral triplet carbene
- 2 covalent bonds
- 2 electron donor

Ligands viewed as being neutral  $2e^-$  donors

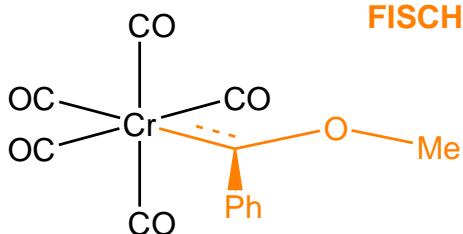

- dianionic  $\text{CR}_2^{2-}$
- 2 bonds ( $\sigma$  and  $\pi$  donation)
- 4 electron donor

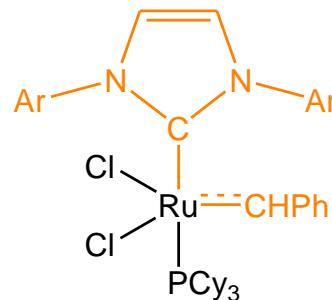

Ligands not neutral

# Transition Metal Carbene Complexes

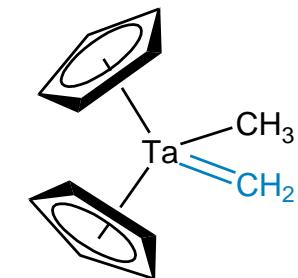

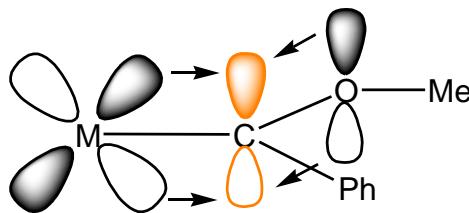

## - Examples :

FISCHER

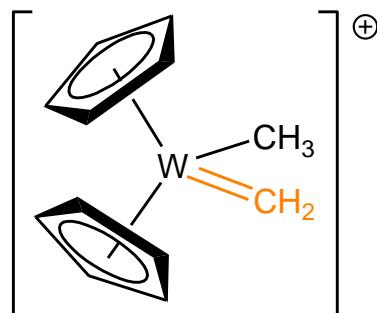

SCHROCK

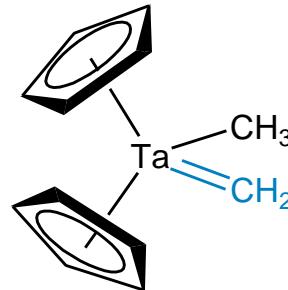

## - Exceptions :

If Schock  
 $W^{VI} = d^0$   
 $2 \times Cp^- = 12$   
 $Me^- = 2$   
 $CH_2^{2-} = 4$   
Total = 18

If Fischer  
 $W^{IV} = d^2$   
 $2 \times Cp^- = 12$   
 $Me^- = 2$   
neutral  $CH_2 = 2$   
Total = 18

FISCHER !!!

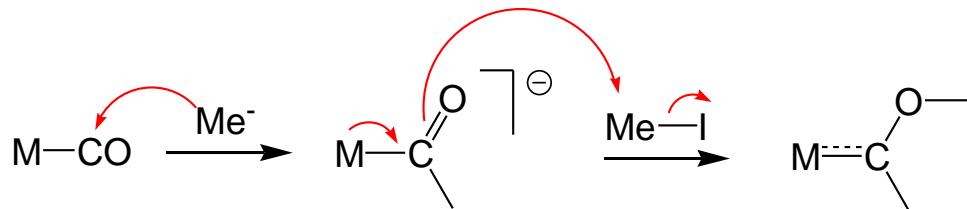

SCHROCK

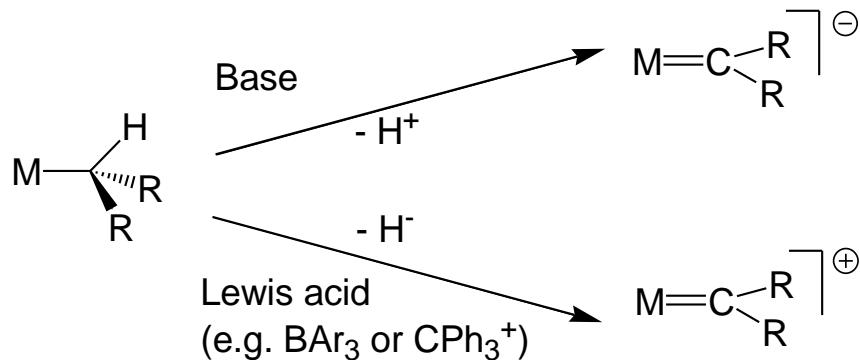

$Ta^V = d^0$   
 $2 \times Cp^- = 12$   
 $Me^- = 2$   
 $CH_2^{2-} = 4$   
Total = 18

# Synthesis of Carbene Complexes

Acyl or Iminoacyl Complex + Electrophile :

From alkyls with  $\alpha$ -hydrogens

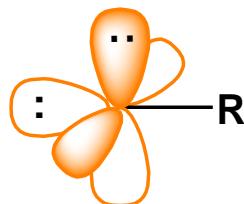

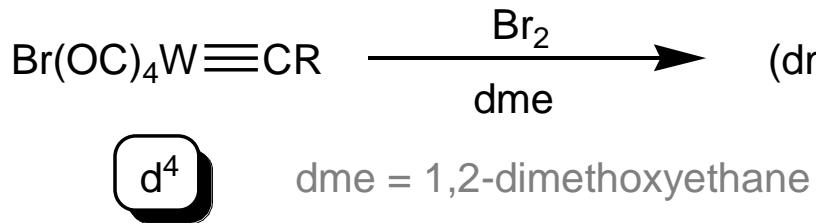

Using a carbene source (e.g. a diazoalkane,  $\text{R}_2\text{C}=\text{N}=\text{N}$ )

# Metal Carbyne Complexes

- Also Fischer and Schrock bonding extremes, but the distinction is less marked → considerable ambiguity in many cases.

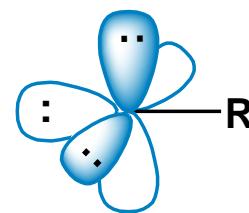

FISCHER

$\text{CR}^-$  = an LX-type ligand

1 x  $\sigma$ -donor  
1 x  $\pi$ -donor  
1 x  $\pi$ -acceptor

SCHROCK

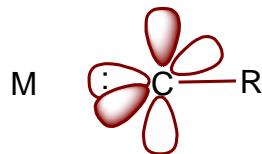

$\text{CR}^{3-}$  = an  $X_3$ -type ligand  
(similarities with  $\text{N}_3^-$  and  $\text{C}^{4-}$ )

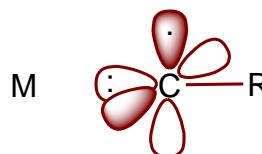

1 x  $\sigma$ -donor  
2 x  $\pi$ -donor

# Metal Carbyne Complexes

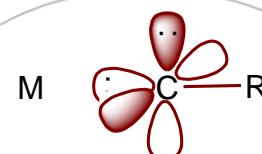

## Fischer Carbyne

- cationic CR<sup>+</sup> (2 e<sup>-</sup> donor)
- 1 donor covalent bond + 2 vacant p-orbitals for M-->L π-backdonation

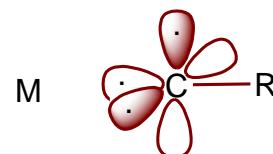

- neutral doublet CR (3 e<sup>-</sup> donor)
- 2 covalent bonds + 1 vacant p-orbital for M-->L π-backdonation

- anionic CR<sup>-</sup> (4 e<sup>-</sup> donor)
- 2 donor covalent bonds + 1 vacant p-orbital for M-->L π-backdonation

## Schrock Carbyne

- Carbynes (CR) are not redox active ligands

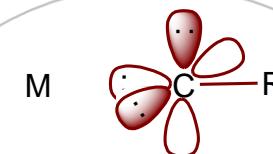

- neutral quartet CR (3 e<sup>-</sup> donor)
- 3 covalent bonds

Ligand cationic

Ligands viewed as being neutral 3e<sup>-</sup> donors

- useful for electron counting if you don't know if a CR<sub>2</sub> ligand is a Fischer or Schrock carbene.

- trianionic CR<sup>3-</sup> (6 e<sup>-</sup> donor)
- 3 donor covalent bonds

Ligands anionic

- Better method for working out the formal oxidation state of a metal coordinated to a CR<sub>2</sub> ligand. Using this method, Schrock carbynes are almost always found with d<sup>0</sup>-metals
